BLOSUM62 Gapop 10.0 , Gapext 0.5 Scoring table:

127853 seqs, 47026705 residues Searched:

12786. Total number of hits satistying chosen parameters:

Minimum DR soq Tength: 0 Maximum DR seq Tength: 2000000000

Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 45 summeries

SwissProt_41:* Database :

Fred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pro-insulin is produced by treating recombinant precursor protein with a mercaptan to provide 2-10 SH residues per Cys residue, in presence of a chostropic agent and in aq. medium of pH 10-11. Lieuting the productopic agent and in aq. medium of pH 10-11. Insolating the produces of a discorbed resin per 1 aq. medium of pH 4-7, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin and correctly bonded Cys bridges. Compared with known methods it involves fewer stages (esp. no sulphibliopsis or cyanogen bromide cleavage) and overail losses during purification are reduced, i.e. the process is quirker and gives better yields. Sequences of issulin chain A, B and C are given in AAK68895-97. Sequences of pro-insulin 1-4 are given in: AAK68896-901.

```
This sequence represents a human insulin precursor comprising insuling A and B chains. This insulin precursor is a component of the chimeric protein component of the chimeric protein advances high-mini-profusulin (AAY4286) and the chimeric protein advanced given in AAY42861. These chimeric proteins additionally contain an component of human growth hormone (hdH) and a cleavable of view in AAY42861. The hdH portion of the chimeric protein acts of computer (AAY42857). The hdH portion of the chimeric protein acts as an intramolecular chaperone (IMC) for the insulin precursor, containing it to fold correctly. The chimeric protein of the chimeric protein to be removed after folding has taken place, eroduction of recombinant human insulin via an hdH-poinsulin chimeric protein conformation insulin via an hdH-poinsulin chimeric protein conformation insulin with correctly linked cysteine bridges with concentral protein and decrease not only protect insulin sequences from intracellular degradation by a microorganism host, but also produced the fusion proteins, thus allowing roiding of the fusion shorts are allowed a protein also protein and decrease the intermolecular interactions among the fusion proteins, thus allowing roiding of the fusion proteins are deviced along a protein and company and a protein along a communication steps can this a result of publication steps can this a result of publication and metroagelum of the fusion protein and the commentation along a beginning a percursor.

Involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overall losses during purification are reduced, i.e. the process is quicker and gives better yields. Sequences of insulin chain A, B and C are given in AAR68895-97. Sequences of pro-insulin 1-4 are given in AAR68898-901. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           with a mercaptan to produced by treating recombinant precursor protein with a mercaptan to provide 2-10 SH residues per Cys residue, in presence of a chactropic agent and in aq. medium of pH 10-11, reating the produced with 3-50 g hydrophobic adsorber resin per I aq. medium of pH 4-7, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin with correctly bonded Cys bridges. Compared with known methods it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overali losses during purification are reduced, i.e. the process is quicker and gives better yields.
                                                                                                                                                                                                                                                                                                                                       1 FVNQHLCGSHLVEALYLVCGERGFFYTPKTRGIVEOCCTSICSLYQLENYCN 52

Contq. Arg or Lys at the N and C-termini; R3 = a natural amino
Contq. Arg or Lys at the N and C-termini; R3 = a natural amino
Contq. Arg or Lys at the N and C-termini of Proinsulin. The reaction
C recommend and results in proinsulin with correctly linked cystine
C bridges. Reaction with trypsin and opt. carboxypeptidase B yields
C correctly folded insulin. The insulin is isolated by absortion on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SORT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             presence of a chaotropic agent and in aq. medium of pH 10-11, treating the prod. with 3-50 g hydrophobic adsorber resin per 1 ag medium of pH 4-7, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin with correctly bonded Cys bridges. Compared with known methods it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Profinsulin is produced by treating recombinant precursor protein with a mercaptan to provide 2-10 SH residues per Cys residue, in

The present sequence is that of a fusion protein, produced in Electivative tendans an example of a proinself molecule corresp.

Formula (11), X = Lys. Arg or a peptide of 2.35 amino acids (11), X = Lys. Arg or a peptide of 2.35 amino acids contq.

Lys or Arg at the N- and C-termini: Y = a natural amino acids

Phe or a bond; R2 = H, Arg. Lys, a peptide of 2-45 amino acids

contq. Arg or Lys at the N- and C-termini: N = a natural amino acids

acid: (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences from human or other insulin. The proinsulin molecules released by residues of mercaptan per Cys residue of proinsulin. The reaction

takes place in the presence of a chaotropic auxiliary agent at the 10-11 and results in proinsulin with correctly linked eystine bridges. Reaction with trypsin and opt. carboxypeptidase B yields correctly folded insulin. The insulin is isolated by absortion on

hydrophobic resin.

```
Continents proceed to the sequence given in A442855, a cleavable peptide linker (AA42857), and a human insulin presursor comprising insulin and a human insulin presursor comprising insulin and a human insulin presursor comprising insulin and a nintramolecular chaperone (MC) for the insulin precursor.

Conteminal Asy residue which enables the holl portion of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin via an holl proinsulin chimeric protein can provide human insulin with correctly linked cysteine bridges with provide human insulin with correctly linked cysteine bridges with of human insulin with correctly linked cysteine bridges with the man insulin. The IMC sequences not only protect insulin sequences from intracellular degradation by a microorganism host, but also promote the folding of the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fusion proteins, thus allowing folding of the fusion proteins.

AAQ86425 encodes AAR71692 mating factor alpha I-Insulin precursor ArgB31. ArgB31 comprises the B and A chains of a claimed human insulin derivative. In the final claimed composit, they are covalently connected via disulphide bonds between Cys residues A7/B7 and A20/R19. The derivative, which may be present as a zinc ion complex, can be used as a fast action treatment for disbetes. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       96 FVNQBEGGSHUVEALYLYCGERGEFYTPKTRGTVEGGGTSIGSLYGGENYCN 137

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sabs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A new method for the production of recombinant human insalin comprises folding a hybrid polypeptide comprising profusulin under conditions that permit correct disulphide bond formation and subjecting that folded protein to enzymanic cleavage. The insulin produced can then be purified. This sequence is a SOB-insulin briain Arabin hybrid polypeptide and is encoded by the plasmid construct pBBAST-LAT results in the efficient cypression of the profusion of the production the production hybrid polypeptide, useful for human insulin production. The method produces recombinant human insulin dentical to the natural hormone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant insulin prodn. by correctly toiding pro-insulin hybiid polypeptide - then enzymatic cleavage of folded product, does not require sulphite protection of SH nor use of cyanogen bromide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        identical to the natural hormone. Hazardous and commersione procedures involving cyanosen bromide and sulphitolysis to protect SH groups are avoided since the entire hybrid polypeptide folds efficiently to the native structure even with the leader attached
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 FVNQHLCGSHLVEALYLVCGERGFFYTPKTRGIVEOCCTSICSLYQLENYCN 52

                                                                                                                                                                                                                                                                                                                                                                                                                                                               Side
                                                                                                                                                                                                                                                                                                                                   ANUMEA29 encodes AAR71694 mating factor alpha 1-insulin precursor Arghl, Arghla Nickeminal EEARARAR. The insulin precursor comprises the B and A chains of a claimed human insulin derivative preceded by the Niterinal amino acids EEARARAR. In the final claimed compstitute are covalently connected via disulphine bonds between Cystersidues A7/87 and A20/819, the derivative, which may be present as a zinc ion complex, can be used as a tast action freatment for
       Human insulin precursor ArgB1, ArgB31: d abetes; Zinc ion complex: mating factor alpha 1; N-terminal EEAEAF \forall.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human insulin precursor ArgBl, ArgB31: diabetes; Zinc ion complex; mating factor alpha 1; N-terminal EEAEAFAER.

AAQ86432 encodes AAk71695 mating factor aipha 1-Insulin precursor ArgB1, ArgB1 N-terminal EEA NEAER. The insulin precursor comprises the B and A chains of a claimed human insulin derivative preceded by the N-terminal amino acids EEAEARER. In the final claimed compsorthey are covalently connected via disulphide bonds between Cystresiducs A7/RP and A20/RB9 The derivative, which may be present as a zinc ion complex, can be used as a last action treatment for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Insulin; precursor; growth hormone; chaperone; intramolecular;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAR11899
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                     This sequence represents a chimeric protein, which contains an Kiterminal framment of human growth hormone (NGS) of the sequence given in AAV4265, a cleavable peptide linker (AAV42657), and a brown issuits precursor comprising linking to elaune (AAV42659). The BH portion of the chimeric provein area as an intra-received the High portion of the inserin precursor, ambling it to foll contectly. The character perturbation of the chimeric protein to be removed after building has the host portion of the chimeric protein to be removed after folding has taken place.
                                                                                                                                                                                                                                                                                                                                                                                                           interactions among the fusion profess. Thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedures steps of eyanogen bromide cleavage, oxidative sulphitolysis and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent
                                                                                                                                                                                                                                                                                                                        Production of recombinant human insulin via an hGH-proissulin chizeric protein can provide human insulin with correctly linked cystice bridges will fewer necessary procedural steps, and hence resulting in a higher yield of human insulin. The IMC sequences not only protect insulin sequences from intracelular degradation by a microorganism host, but also promote the folding of the fusel insulin precursor, lacilitate the solubility of the fusion protein and decrease the intermojecular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /label-Lys residue linking insulin B chain to A chain
                                                                                                                                                            New chimeric proteins containing human growth hormone fragment, used particularly for the production of human insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Proinsulin analogue with a Lys residue 'inking the A and B chains.

Human insulin; recombinant production; amorphous; monospherical form; diabetes mellitus.
                                                                                                                                                                                                                                                                                                ×.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is a specific example of an insulin derivative which can be obtained in amorphous, monospherical form by dissolving in an opropanol/buffer mixture (pH 4.5-6.5) having n-propanol content 15% relative to water. The solution is then diluted with water to
                                                                                This human insulin precursor has correct y positioned disulphide bridges between the A and B chains and i more resistant to proteolytic dyestion than prior art insulin precursors. Yeast strains transformed with DNA encoding this precursor can be cultured to secrete it in high yields. The precursor can be conveited into mature human insulin by transpeptidation. See also AARIS97-98.
